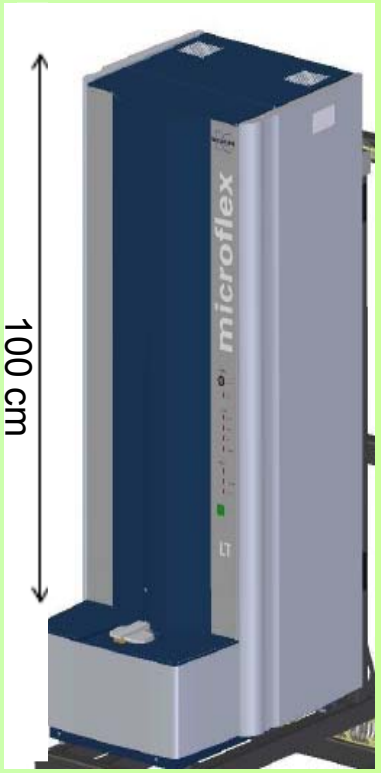
MALDI-TOF MS

- **Matrix-Assisted Laser Desorption Ionization (MALDI)**

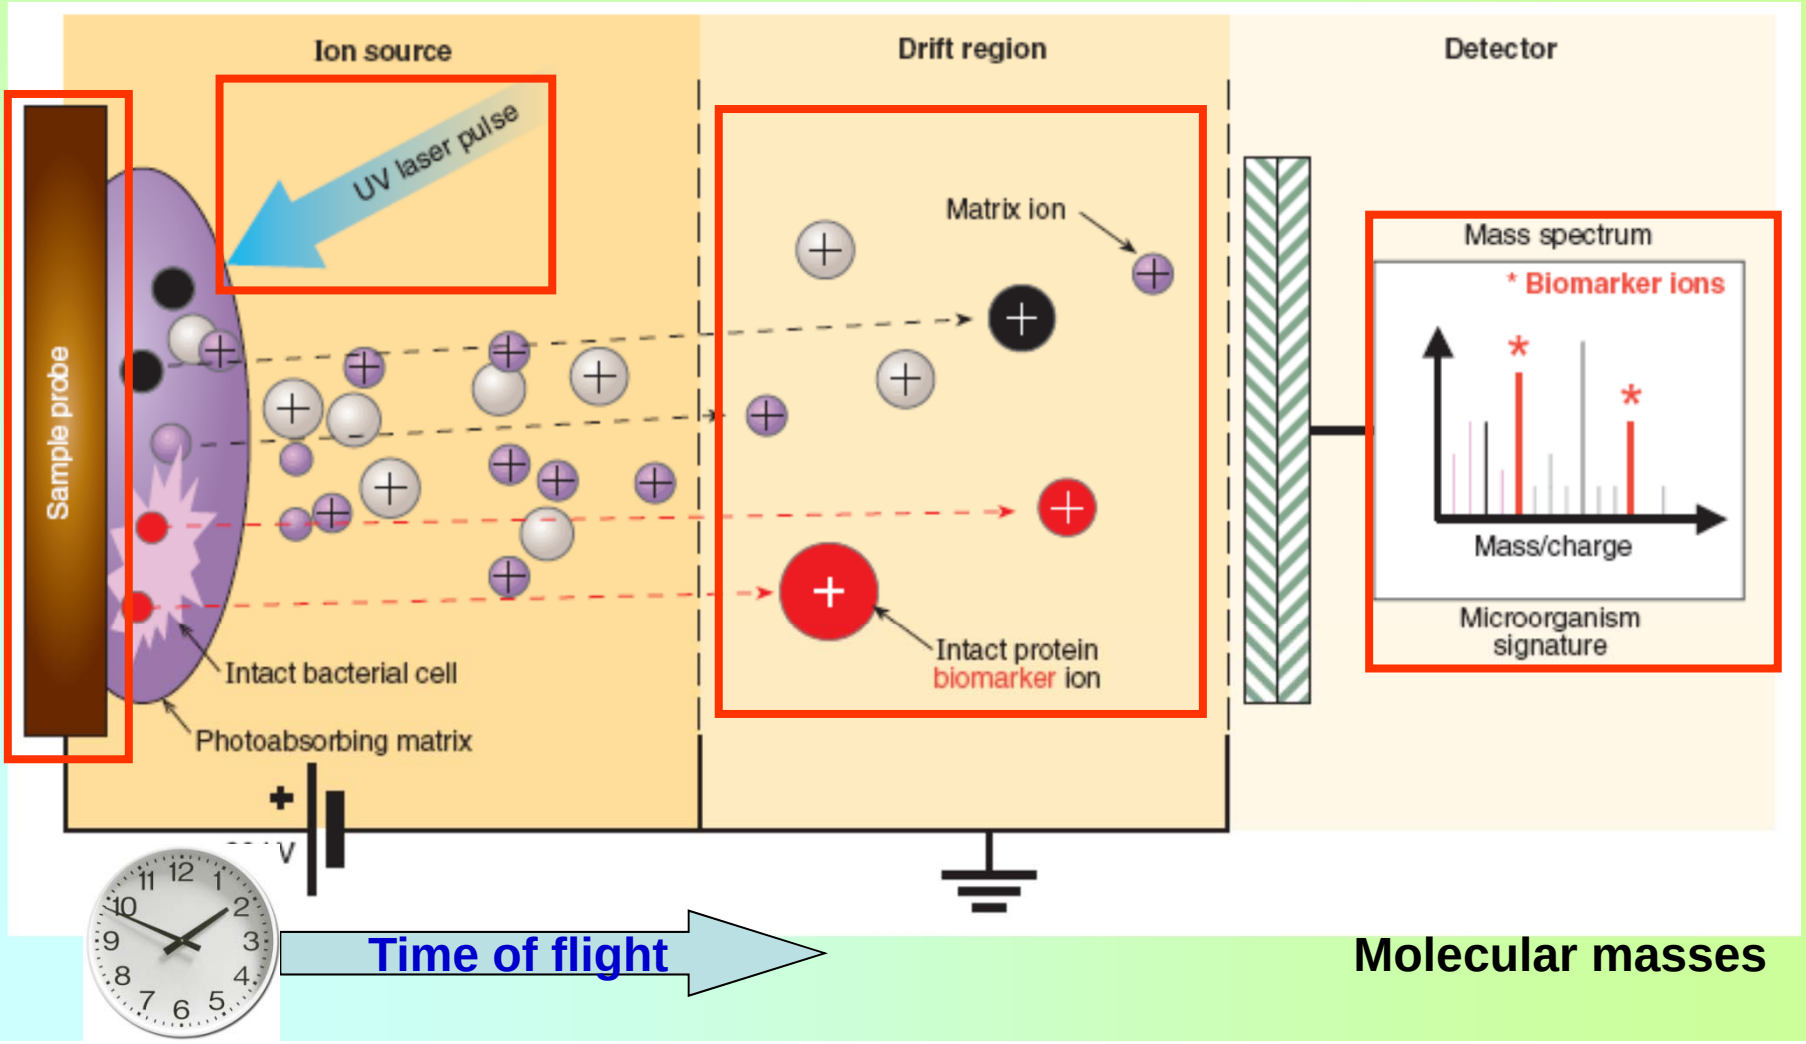
with analysis of

- **Time-Of-Flight (TOF)**



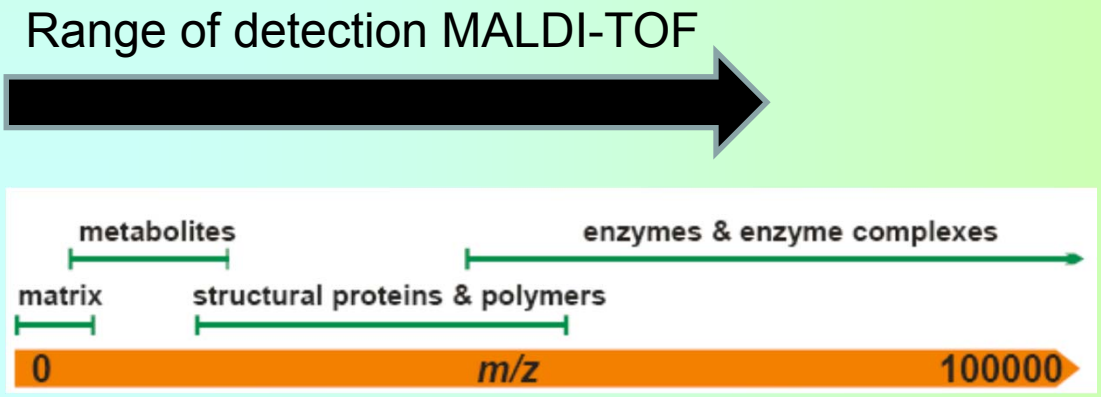
The advantage offered by the MALDI-TOF combination is the capability to easily desorb and analyze positive as well as negative ions from the same sample

Principle of operation of a MALDI-TOF spectrometer for microorganism identification



Biomarkers

- **Cellular compounds detected**
  - ✓ mostly ribosomal proteins or DNA-binding proteins, but also complex lipids and polysaccharides
- **Proteins detected**
  - ✓ extractable, soluble, moderately hydrophilic, stable, and abundant
- **Determination of protein mass signal intensities**
  - ✓ favored by abundance, stability, aminoacid composition (e.g. Arg and Lys)



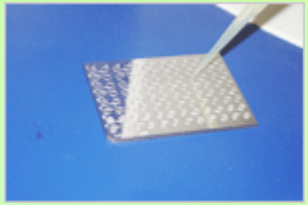
MALDI-TOF for the identification and classification of microorganisms needs dedicated software [e.g., BioTyper (Bruker Daltonics Inc.) or Saramis (AnagnosTec GmbH)] to enable comparisons of the unknown protein with reference molecular masses. Ribosomal proteins are used normally as reference molecular masses as they are most abundant in the cells.

In contrast to bacteria, fungal cell walls are mainly composed of polysaccharides (including chitin), but proteins, lipids, polyphosphates, and inorganic ions are also present. Proteins provide the most characteristics biomarkers available for the analysis of intact organisms without extraction, separation, or amplification.

“Intact” refers to microbial cells suspended in a solution and/or deposited directly onto a the sample holder. While exposure to water, organic solvent, and/or strong acid in the MALDI matrix lyses most vegetative bacteria, a lysis step, such as exposure of the fungus to a strong organic acid, is required to obtain a MALDI spectrum.

YEASTS protocol

Extraction mandatory



Formic acid 70%
Acetonitrile 100%

EtOH 70%

Direct deposition of samples on target plates at the bench

Processing by MALDI-TOF MS

Valid and accurate result

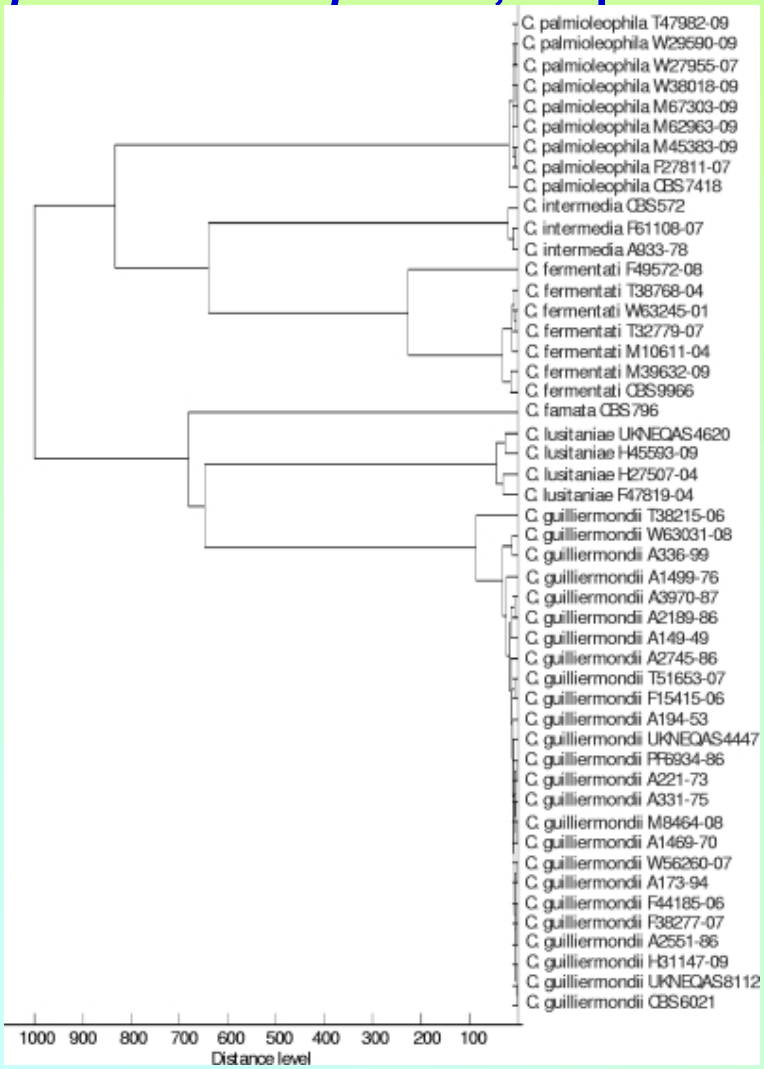
Cluster analysis of MALDI-TOF MS spectra of selected reference or challenge isolates of *C. neoformans*

MALDI-TOF for characterization of *Candida palmioleophila*, a previously overlooked patogen



Score-oriented dendrogram to cluster the MALDI-TOF mass spectra obtained for all included isolates. All samples were named based on molecular identification, illustrating the complete agreement between ITS sequencing and the MALDI-TOF spectra.

C. palmioleophila has previously been misidentified as *C. famata* or *C. guilliermondii.*

The susceptibility pattern for *C. palmioleophila* is unique, with low echinocandin MICs (range, 0.008 to 0.125 µg/ml) and high fluconazole MICs (range, 8 to >16 µg/ml). Thus, correct identification of *C. palmioleophila* is important.

Identification is possible yet laborious with conventional techniques, whereas MALDI-TOF MS easily separates the related species.

- From specimen extraction to final result: 25 min

MALDI-TOF Identification of Filamentous Fungi: Which is the Reality?

- In contrast to bacteria or yeast, relatively few data are available regarding the identification of filamentous fungi
- This due to the lack of standardized protein extraction protocols for filamentous fungi and the poor number of spectra currently included in the database of commercially available devices

Filamentous fungi: state of the art

Study	No. of isolates/species	% of isolates identified
De Carolis *et al.* 2012	*Aspergillus*, *Fusarium*, and *Mucorales* 103 isolates 29 species	96.8
Coulibaly *et al.* 2011	*Scedosporium* 25 isolates 7 species	100
Alanio *et al.* 2010	*Aspergillus* 140 isolates 28 species	98.6
Marinach *et al.* 2009	*Fusarium* 62 isolates 9 species	92
Erhard *et al.* 2008	*Dermatophytes* 20 isolates 5 species	100

Identification of filamentous fungi remains difficult

- Biological complexity
- Changes in classification due to the introduction of nucleic-acid based techniques

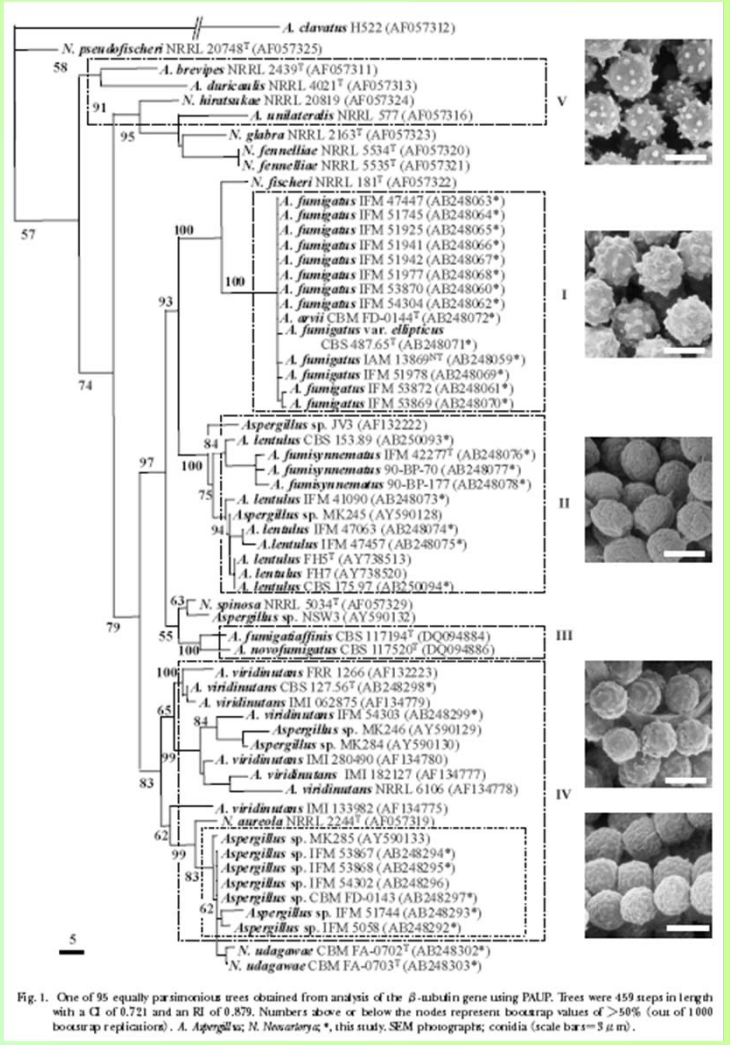

Fig. 1. One of 95 equally parsimonious trees obtained from analysis of the β-tubulin gene using PAUP. Trees were 459 steps in length with a CI of 0.721 and an RI of 0.879. Numbers above or below the nodes represent bootstrap values of >50% (out of 1000 bootstrap replications). *A. Aspergillus*; *N. Neosartorya*; *, this study. ORIGINAL ARTICLE MYCOLOGY

Matrix-assisted laser desorption ionization time-of-flight mass spectrometry for fast and accurate identification of clinically relevant *Aspergillus* species

Abstract

New *Aspergillus* species have recently been described with the use of multilocus sequencing in refractory cases of invasive aspergillosis. The classical phenotypic identification methods routinely used in clinical laboratories failed to identify them adequately. Some of these *Aspergillus* species have specific patterns of susceptibility to antifungal agents, and misidentification may lead to inappropriate therapy. We developed a matrix-assisted laser desorption ionization time-of-flight (MALDI-TOF) mass spectrometry (MS)-based strategy to adequately identify *Aspergillus* species to the species level. A database including the reference spectra of 28 clinically relevant species from seven *Aspergillus* sections (five common and 23 unusual species) was engineered. The profiles of young and mature colonies were analysed for each reference strain, and species-specific spectral fingerprints were identified. The performance of the database was then tested on 124 clinical and 16 environmental isolates previously characterized by partial sequencing of the β-tubulin and calmodulin genes. One hundred and thirty-eight isolates of 140 (98.6%) were correctly identified. Two atypical isolates could not be identified, but no isolate was misidentified (specificity: 100%). The database, including species-specific spectral fingerprints of young and mature colonies of the reference strains, allowed identification regardless of the maturity of the clinical isolate. These results indicate that MALDI-TOF MS is a powerful tool for rapid and accurate identification of both common and unusual species of *Aspergillus*. It can give better results than morphological identification in clinical laboratories.

ATCC, American Type Culture Collection (Manassas, VA, USA); CBS, Centraalbureau voor Schimmelcultures (Utrecht, The Netherlands); CG, culture strain collection of the Università La Sapienza (Rome, Italy); FL, culture strain collection of the University Hospital of Innsbruck (Innsbruck, Austria); IUM, culture strain collection of the Università degli Studi di Milano (Milan, Italy); UCSC, culture strain collection of the Università Cattolica del Sacro Cuore (Rome, Italy).

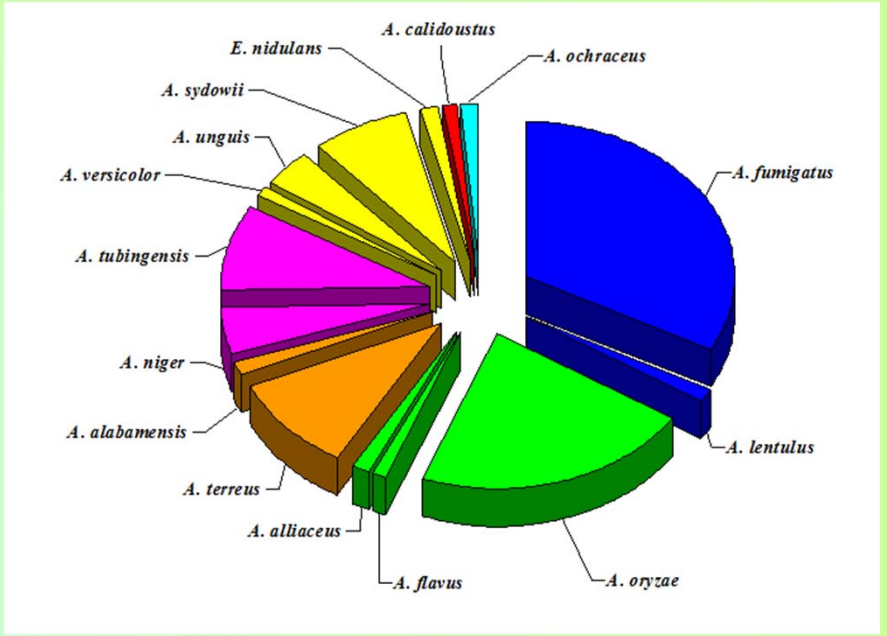
[a]A total of 109 fungal strains were used. With the exception of the ATCC-type and CBS-type strains, those from the other collections were identified molecularly, based on *β-TUB* and/or *CAM* (for *Aspergillus* strains), *EF-1α* (for *Fusarium* strains) and ITS1-5.8S-ITS2 (for *Mucorales* strains) gene sequence comparison.

- Reference spectra at different stages of maturation:
  - ✓ 109 from young colonies
  - ✓ 109 from mature colonies (diameter > 3 cm)
- 67 reference strains of *Eurotiales*
- 42 reference strains of *Mucorales* and *Hypocreales*

From: De Carolis *et al*., CMI 2012, in press

Challenge of 103 clinical isolates Identification by multilocus sequencing

- Sequence analysis of the ITS1-5.8S-ITS2, β-*TUB*, *CAM*, and/or *EF-1α* gene regions was used as the reference identification method
- 85 isolates were unequivocally identified to the species level
- 18 isolates producing ambiguous results were initially identified to the genus level (*Aspergillus* section *Flavi*)
- Further molecular analysis assigned these isolates to the species *Aspergillus oryzae* (17 isolates) and *Aspergillus flavus* (1 isolate)



Challenge of 103 clinical isolates Identification by MALDI

- MALDI-TOF MS identified, according to their designated species, 91 of 94 clinical isolates (96.8%) of *Aspergillus*, *Fusarium* and *Mucorales*
- The log(-score) values of the 91 isolates with correct results were all higher than 2.0, whereas three isolates with a log(score) value of <2.0 (1.817, 1.874 and 1.796, respectively) could be identified only to the genus level, but had concordant species designations as compared with the results of the reference method
- By contrast, the clinical isolates that belonged to species not included in our database (9 isolates: 3 *Alternaria alternata*, 2 *Scedosporium prolificans*, 2 *Curvularia*, 1 *Beauveria bassiana*, 1 *Cladosporium*) had all log(score) values of <1.7, thereby confirming the specificity of MALDI-TOF MS identification

Cluster analysis of MALDI-TOF spectra of selected reference strains and challenge isolates (CH15, CH25 and CH51) identified as *Aspergillus* section *Flavi* species

Case Report

First case of breakthrough pneumonia due to Aspergillus nomius in a patient with acute myeloid leukemia

MORENA CAIRA*, BRUNELLA POSTERARO†, MAURIZIO SANGUINETTI†, ELENA DE CAROLIS†, GIUSEPPE LEONE* & LIVIO PAGANO*
*Institutes of *Hematology and †Microbiology, Università Cattolica del Sacro Cuore, Rome, Italy*

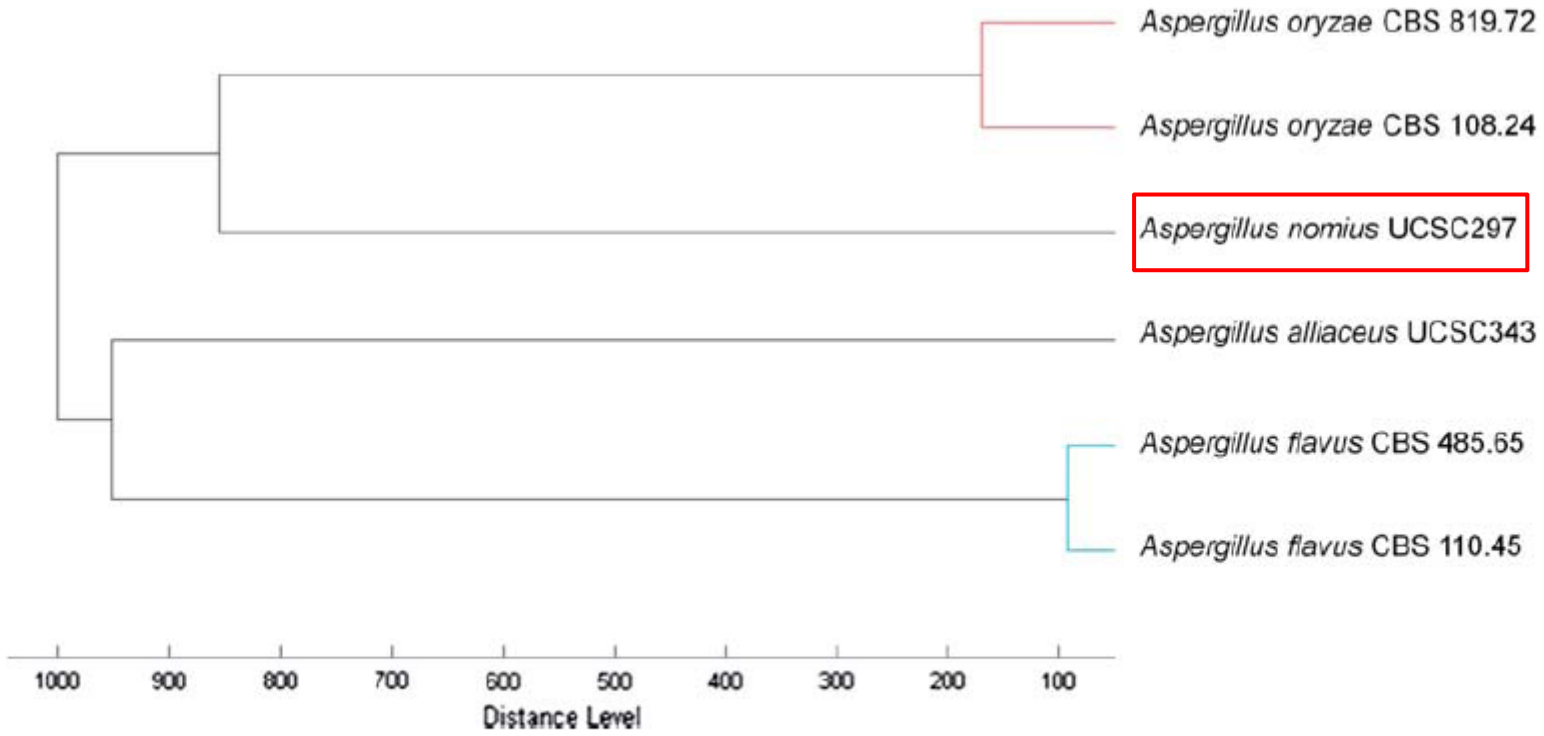

Fig. 3 Cluster analysis of matrix-assisted laser desorption ionization time-of-flight mass spectrometry spectra of selected strains identified as *Aspergillus* section *Flavi* species. Distance is displayed in relative units. *Aspergillus nomius* (UCSC297; this study) and *Aspergillus alliaceus* (UCSC343) are clinical isolates.

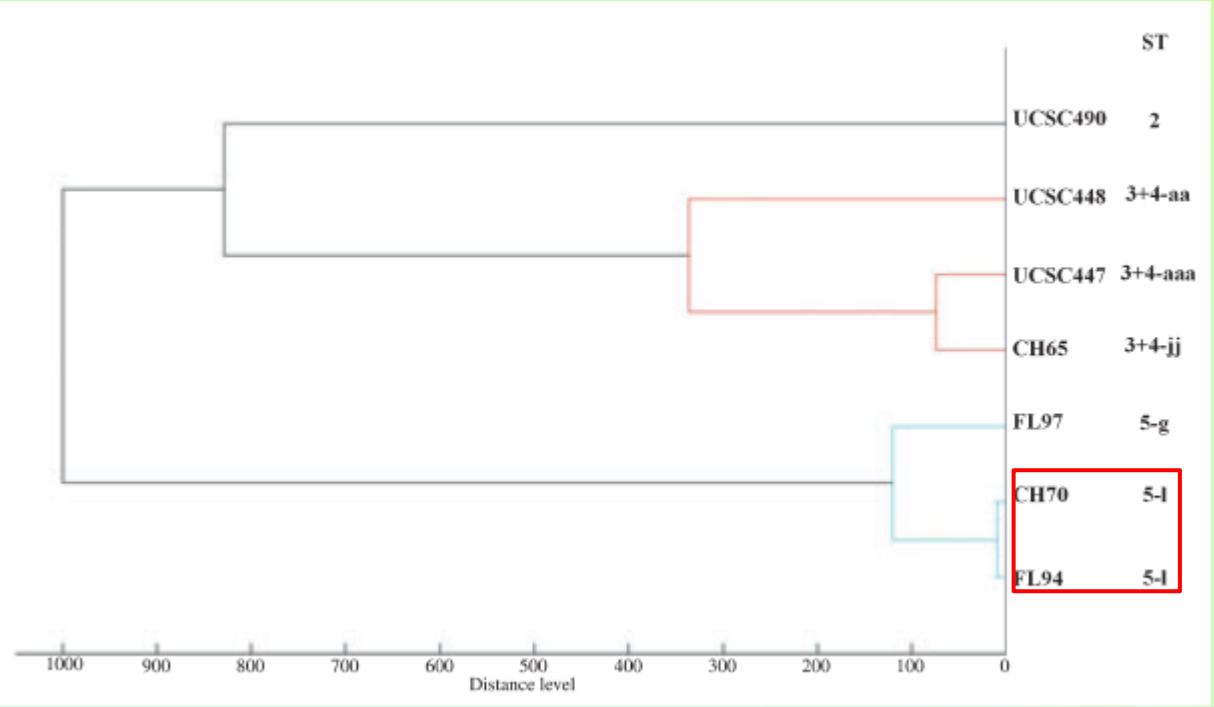
Fusarium solani species complex subtyping



FUSARIUM-ID database SEQUENCE TYPE

Mass spectrometry-based dendrogram VS MLST

The strains were clustered in separate groups according to their phylogenetic species designation

- Each MSP is compared with the other in a matrix of cross-wise identification values. The matrix is used to calculate the distance values for each pair
- Based on the protein mass patterns, strains can be clustered hierarchically

RAPID COMMUNICATION

MALDI-TOF MS-based drug susceptibility testing of pathogens: The example of *Candida albicans* and fluconazole

Carine Marinach[1,2], Alexandre Alanio[1,2,3*], Martine Palous[3], Stéphanie Kwasek[1,2], Arnaud Fekkar[1,2,3], Jean-Yves Brossas[1,2,4], Sophie Brun[1,2,3], Georges Snounou[1,2,5], Christophe Hennequin[1,2], Dominique Sanglard[6], Annick Datry[3], Jean-Louis Golmard[7*] and Dominique Mazier[1,2,3*]*

- Inoculum 10^6 yeast/ml
- Turnaround time 15 h
- Acid extraction
- End-point reading objective
- Cost less than 1 euro

MPCC determinations were concordant with MIC BDM irrespective of the type of drug resistance mechanism

Use of matrix-assisted laser desorption ionization-time of flight mass spectrometry (MALDI-TOF MS) for caspofungin susceptibility testing of *Candida* and *Aspergillus* species

[a]Isolates include clinical (n = 40), reference (n = 3), and laboratory mutant (n = 1) strains.
[b]n, no. of isolates tested.
[c]WT, wild-type at mutational hot-spot regions of Fks1 and Fks2. Otherwise, the specific amino acid substitutions harbored by mutant strains are indicated.
[d]Geometric means values in μg/ml (three repetitions from separate preparations) are given.

Use of matrix-assisted laser desorption ionization-time of flight mass spectrometry (MALDI-TOF MS) for caspofungin susceptibility testing of *Candida* and *Aspergillus* species

Elena De Carolis,[1#] Antonietta Vella,[1#] Ada R. Florio,[1] Patrizia Posteraro,[2] David S. Perlin,[3] Maurizio Sanguinetti,[1*] and Brunella Posteraro[4]

MALDI-TOF intact cell MS (Pros)

- Rapidity
- Inexpensiveness in terms of labor and consumables
- High discriminatory power, accuracy, and superiority over morphological analysis and conventional identification
- Ability to easily differentiate species that are morphologically and phylogenetically similar to each other

MALDI-TOF intact cell MS (Cons)

- MALDI-TOF MS equipment is not cheap
- Molecular diagnostic techniques are still required in cases for which no reference spectra are present in the MALDI-TOF MS databases at the time of analysis
- Apart from positive blood cultures, MALDI-TOF cannot yet used directly on patient samples
- Also, the system is not able to identify the presence of several different pathogens in a sample

CONCLUSIONS (1)

- MALDI-TOF identification still requires a growth step in order to obtain fungal colonies for acquisition of spectra
- Apart from positive blood cultures, MALDI-TOF cannot yet used directly on patient samples
- Also, the system is not able to identify the presence of several different pathogens in a sample

CONCLUSIONS (2)

- In addition to the identification process, other aspects of microorganism analysis, such as the search for virulence factors and drug resistance determinants, and typing, will be expanded enormously
- This, in combination with the potential of each laboratory to create its own reference database to be widely used and shared, will help to extend MALDI-TOF analysis in clinical mycology laboratories
